## ALIGNMENTS

```
subjunit of varicella zoster virus - used in a therapy and prophylaxis of infection.

Claim 8; Fig 4H: 39pp; English.

A human anti-varicella zoster virus monoclonal antibody was prophusing the triona method of Ostberg et al. (1983) Hybridona 2:351-350.

English triona neutralised vzv in the absence of complement. This cell line, designated cell line TC94RA9, produced an antibody designated 93RA9, chNA for the light and heavy chain variable region genes of the 93RA9 antibody where cloned using PCR. At least two heavy chain (gamma-1) and two light chain (kappa) specific clones were sequenced (see 082749 s 282750 respectively).
                                                                                                        Varicella zoster virus; VZW; anti-VZW monoclonal antibody; 93KA9; glycoprotein II subunit; vaccine.
                                                              02-0CT-1995 (first entry)
93RA9 anti-Varicella zoster virus antibody heavy chain variable.
                                                                                                                                                                                                                                                                                                               WOSOUCH 1994; U08241.

Cancer 6. Cardinal 4, Fig 2; 128pp; English.

Claim 4, Fig 2; 128pp; English.

This polypeptide sequence comprises the heavy chain variable region (VH), HBB1, obtained by mutagenesis of the VH CDR3 of human carcinoembryonic antigen (hCBA)-specific antibody CB6 (see W19881). A claimed specific binding member (A) comprises an hCBA specific antibody antigen binding domain that has a dissociation of specific antibody antigen binding domain that has a dissociation constant for hCBA of less than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 contracellular domain of hCBA and/or to cell-associated hCBA over hCBA over hCBA over hCBA or to cell-associated hCBA over hCBA over soluble hCBA. Preferred (A) include pairings of VH and VL sequences from CBA1-7 (see W19876-85), or their CDP sequences, as well as CBA6 VH and VL variants (see W1986-95) obtained by mitagenesis or chain shuffling. An example of a claimed pairing

The additional N-linked glycosylation sites are introduced at locations which impair complement fixing and Pe receptor binding ability. They are preferably located in the CH2 region of the iq molecule. Antibodies bearing multiple sialyl-Lex determinants are useful for disrupting undestrable interactions between cells or proteins. Disrupting this interaction has therapeutic applications, for example, in minimising inflammation following tissue injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  as qyylviqsgaevkkppgssvkvsekasggtissyais⇔vrqapgqglewmagiipfifqtor R≀

```
This polypeptide sequence comprises the heavy chain variable region (VH), HBB6, obtained by mutagenesis of the VH CDR3 of human cardionembryonic antigen (hCBA) specific antibody CER6 (see W198B1). A claimed specific binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCEA and/or to cell-associated hCEA over hCEA over soluble hCEA. Preferred (A) include pairings of VH and VL sequences from CEA1-7 (see W19876-85), or their CDR sequences, as well as CEA6 VH and VL variants (see W19886-95) obtained by mutagenesis or chain shuffling. An example of a claimed pairing is HBB6 VH with CEA6 VL (A) is used to defect cells expressing hCEA in vivor or in vitro, especially tumour cells for diagnosing cancer, eg. adenorationma of the colon, lung or breast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             60 yaqkfggrltitadeststaymelsslrsedtavyycagrshtyel-yy--yymdvwggg 116

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCEA and/or to cell-associated hCEA over hCEA over soluble hCEA. Preferred (A) include pairings of VH and VL sequences from CEA1-7 (see W19876-8), or their CDR sequences, as well as CEA6 VH and VL variants (see W19886-95) obtained by mutagenesis or chain shuffling. Examples of claimed pairings are 706D10 VH with 706D12 or CEA6 VL. (A) is used to detect cells expressing hCEA, in vivo or in vitro, especially tumour cells for diagnosing cancer, e.g. adenocarcinoma of the colon, lung or breast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 601; DB 23; Length 123;

Claim 4, Fig la; 128pp; English.

This polypeptide sequence comprises the heavy chain variable region (VH) of human carcinoembryonic antigon (hCEA)-specific antibody CEA. VH (17126-32) and VL (172133-35) gene sequences were obtained for anti-hCEA antibodies CEA1-CEA7 (see W19876-85).

A claimed specific binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant of hCEA of less than 1 x 10 -8 M, is non-cross-reactive with human live hCEA and/or to cell-associated hCEA over hCEA over hCEA and/or to cell-associated hCEA over hCEA over hCEA cequences from CEA1-7, or their CDE sequences, as well as CEA6 VH and VL variants, including combinations of CEA6 VH with VL ceptons from CEA6, Tobog, Tobol, Lubil, Lubil, D. Lusto, Lucial, State of the Respectably tumour cells for diagnosing cancer, e.g. adenocarcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          m
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  60 yaqkfqgrltitadeststaymelsslrsedtavyycagrshnyel-yy--yymdvwgqq 115

               A Simulation From the region gene family restricted antibodies - through B-cell super-antigen vaccination Disclosure; page 78; 130pp; Broflish.

A B-cell superantigen (349) is a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted antibodies. The SAG is used to enhance production of VH, septricted Abs. During attempts to identify sAgs, as a sequences (R54784-801) of H chains from Ig reactive with mod-SpA, and as and DNA sequences (FS4784-801). Of WH regions of SpA binders obtained from combinatorial libraries were determined. IgM protein RAS is derived from the germline configuration of a VH gene

                                                                                                                                                                                                                      Disclosure, Fig 2; 35pp; English.

The sequences given in R31023-24 represent the heavy and light chains of Antihody D respectively. Antihody D is a monoclonal antihody which was derived from peripheral blood lymphocytes from a hepatitis A virus (HAV) sero positive patient. Antihody D is closely related in nature to munifiedy B5B3. Total RNA was isolated from antihody D expressing cells and polydomylated RNA was extracted. Those polyh RNA's were used to prepare a cDNA library which was screened for human Further heavy (H) chains and two positive clones were detected. Sequence 476 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 79 ysqnfqgrvtitadkststahmeltslrsedtavyycatdryrqanfdrarvgw-fdpwg 137
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     All simulations of variable region gene family restricted antibodies - through B-cell super-antigen vaccination Disclosure; Page 77; 130pp; English.

B-cell superantigen (849) is a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted antibodies. The sad is used to enhance production of VH; restricted Abs. During attempts to identify sags, as sequences (R54784-801) of H chains from Ig reactive with mod-SpA, and as and DNA sequences (R54802-16, 02481-56) of VH regions of SpA binders bobtained from combinatorial libraries were determined. IgM protein BOR is derived from the germline configuration of a VH gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  20 qmqvv-qsgaevkkpgssvtvsckasggtfsnyaiswvrqapgqglewmggiiplfgtpt 78

                                                                                                                                                                                                                                                                                                                                                                  by molecular cloning of immunoglobulin genes by PCR Disclosure; Page 68; 94pp. English.

L. and H-chain DNA was amplified by PCR from Graves' orbital tissue and clones encoding autoimmune-associated immunoglobulin fragments were obtained. 13/15 clones of H chain (1931) genes showed homology to the closest germline genes, DP10 (089327) and hv1263 (089328). The DNA (089329) and corresp. amino acid (R72070) sequences of the VH region of a representative clone, Sequence 98 AA.

Treating domerulonephritis with antibody against complement C5 component - to inhibit complement induced cell lysis brample il. Fuge 119-122, 181pp. English - to inhibit complement induced cell lysis brample il. Fuge 119-122, 181pp. English - to make discovered from monse antibody control of the can be co-expressed with a humanised light chain (P77610), includes CPRs derived from monse anti-C5 monoclonal antibody 501.1. It can be co-expressed with a humanised light chain (P77612) in human 278 ERNA cells using encoding DNAS subcloned into vector APEX.*P (T08475). Such humanised recombinant antibodies retain the ability of MAP 501.1 to block human complement C5a generation and thus to reduce glomerular inflammation and kidney dysfunction associated with glomerulonephritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Progret is the heavy chain of the binan anti-herpes monoclonal autitody clone EachsVW. This anticody is capable of neutralising both herpes simplex virus (HSV) types I and II by binding an epitope present on diveoprotein D. The anticody may be used for detection (HSV) in vivo on in vitro; for passive immunotherapy (pref. prophylactically) of HSV infection (eq. qenital, oral or coular herpes), partie, as its Fab fragment and as a competitive reagent for detection neutralising anti-HSV antichodies in a sample. Anti-idiotypic antichodies raised against the mAb can be used for active immunotherapy of HSV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  79 yaqkfqgrvtmtadtststaymelsslrsedtavyycaryffgss-pu---wyfdvwqqq 134

C A process for isolating and synthesising human monoclonal anti-tumour

antibodies has been produced. The process involves: (a) constructing at

antibodies has been produced. The process involves: (a) constructing at

the page library in a binding assay with cultured tumour calls of the

same type as the patient; (b) screening for anti-tumour antibodies in

the page library in a binding assay with cultured tumour calls of the

same type as the patient; stumour; (c) removing extraneous antibodies in

step (b) and (c); (e) assaying the specificity of cloning the phage selected in

step (b) and (c); (e) assaying the specificity of cloned phage that do not bind

continued tumour cells derived from more than one other tumour that is

to cultured tumour cells derived from more than one other tumour that is

continued tumour cells derived from more than one other tumour that is

continued tumour cells antibody fusion phage library, produced by

chain antibody from a VH antibody fusion phage library, produced by

a method as described above. The antibodies produced can be used for

diagnostic and therapeutic applications and for isolating tumour

continued the study and applications and for isolating tumour

continued the study and applications of for isolating tumour

continued the study and antibody from or isolating tumour

continued the study and applications and for isolating tumour

continued the study and antibody from a see as anti-cancer vaccines.

Anti-melanoma antibody 2-71 from VH antibody fusion phage library.
Human: monoclomal antitumour antibody: peripheral blood lymphocyte;
cancer: tumounigenesis; anticancer vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Prodn. of human monoclonal anti-tumour antibodies - by screening a fusion phage library produced using peripheral blood lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The human antibodies have low immunogenicity in humans compared to murine monoclonal antibodies (MAbs). Since the antibodies are isola from fusion phage libraries, their affinity and specificity for a tumour cell line can be improved by genetic manipulations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  59.9%; Score 558; DB 23; Length 119; larity 71.7%; Pred.
